Summary

Backend Software Engineer with 2+ years building scalable, high-throughput distributed systems in **Go**. Owns payment, authentication, and RMS services on a live trading platform; brings expertise in multi-gateway routing, event-driven architecture (**NATS**), and **gRPC** microservices, with a focus on reliability, observability, and clean, well-tested code.

Technical Skills

Languages: Go (Golang), Python, C++, Swift, SQL, Shell Scripting
Backend & APIs: REST, gRPC, GraphQL, NATS, Microservices, Event-Driven Architecture, Concurrency, SSE
Databases: PostgreSQL, TimescaleDB, Redis, ScyllaDB, ClickHouse, Elasticsearch, MySQL
Cloud & DevOps: AWS, Docker, ECR, Bare-Metal Deployments, Grafana, Linux, Git, SSH, CI/CD
Concepts: Distributed Systems, Caching, Load Balancing, Failover, System Design, Data Structures & Algorithms

Work Experience

Software Development Engineer, Backend | [Zanskar Securities](#) April 2025 – Present

- Owned **payment, authentication, and RMS** services on a live trading platform; scaled payment service to **1000+ daily transactions at a 90% success rate** through multi-gateway integration with **smart routing, internal retries, failover, and alerting**.
- Delivered **margin allocation, withdrawal, and settlement flows**, plus standalone **mandate/autopay** service for recurring payments.
- Built **authentication service** handling thousands of requests across web, SDK, and mobile, featuring **QR-based login over SSE, TOTP-based 2FA**, alerting, and analytics/event collection.
- Developed internal **RMS dashboard** for monitoring orders, square-off, and client management, powered by **gRPC, REST, NATS, and Elasticsearch**.
- Deployed services via **Docker and ECR** onto **bare-metal servers** with **Grafana** observability and **Slack** alerting, hardening reliability through **test coverage** and **linters**.

Software Development Engineer, Backend | [Samespace](#) June 2024 – April 2025

- Reduced API response times by 150ms** through backend redesign, Go concurrency, query optimization, and caching mechanisms.
- Built high-performance, scalable services using **Go, NATS (streaming), and ScyllaDB**; integrated in-house **AI capabilities via gRPC**.
- Reduced codebase size by 30%** through clean coding practices and refactoring, improving maintainability and readability.
- Implemented caching strategies to lower resource utilization and delivered robust data solutions across **ScyllaDB, PostgreSQL, and ClickHouse**.

Internships

Software Engineering Intern | [Zuddl](#), [Curie Microelectronics](#), [Plaxonic](#) May 2022 – May 2024

- Delivered production features across native iOS applications (Swift/SwiftUI), including BLE integrations, backend-driven UI, and location services, collaborating with cross-functional engineering teams.

Projects

Upasthit | [SwiftUI](#), [Firebase](#), [Realm](#), [CoreBluetooth](#), [Networking](#) May 2023

- Developed an automated attendance management system that eliminated manual tracking, resulting in a filed **patent application** demonstrating technical novelty.
- Led a team to build user-friendly **native iOS and Android applications**, ensuring accessibility across a wide range of devices.

Education

PDPM IIITDM Jabalpur Nov. 2020 – May 2024

Bachelor of Technology in Electronics and Communication Engineering

Achievements

- Solved **800+ Data Structures and Algorithms problems** across [LeetCode](#), [GeeksforGeeks](#), and [InterviewBit](#).
- Advanced to the final round of the **HackByte 2023** competitive hackathon.
